The rate at which the chemical ?ows in is given by rate in = (5×106) gal/yr $(2 + \sin 2t)$ g/gal. (18) The concentration of chemical in the pond is $Q(t)/107$ g/gal, so the rate of ?ow out is rate out = (5×106) gal/yr $Q(t)/107$ g/gal= $Q(t)/2$ g/yr. (19) Thus we obtain the differential equation $dQ/dt = (5 \times 106)(2 + \sin 2t) - Q(t)/2$.

The simplest differential $C' = C' - \text{decreasing}$ equation whose solutions satisfy these criteria is $C = C e^{-t/w}$. For solutions than to diverge from, we must have $C > C e^{-t/w}$. The required rates are satisfied by the differential $C' = C e^{-t/w}$ equation. $C = C e^{-t/w}$.

Elementary Differential Equations, 10th Edition is written from the viewpoint of the applied mathematician, whose interest in differential equations may sometimes be quite theoretical and sometimes intensely practical. The authors have sought to combine a sound and accurate exposition of the elementary theory of differential equations with considerable material on methods of solution, analysis, and approximation that have proved useful in a wide variety of applications. While the general structure of the book remains unchanged, some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications. In addition to expanded explanations, the 10th edition includes new problems, updated figures and examples to help motivate students.

The 10th edition of Elementary Differential Equations and Boundary Value Problems, like its predecessors, is written from the viewpoint of the applied mathematician, whose interest in differential equations may sometimes be quite theoretical, sometimes intensely practical, and often somewhere in between. The authors have sought to combine a sound and accurate (but not abstract) exposition of the elementary theory of differential equations with considerable material on methods of solution, analysis, and approximation that have proved useful in a wide variety of applications. While the general structure of the book remains unchanged, some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications. In addition to expanded explanations, the 10th edition includes new problems, updated figures and examples to help motivate students. The book is written primarily for undergraduate students of mathematics, science, or engineering, who typically take a course on differential equations during their first or second year of study. The main prerequisite for reading the book is a working knowledge of calculus, gained from a normal two or three semester course sequence or its equivalent. Some familiarity with matrices will also be helpful in the chapters on systems of differential equations. WileyPLUS sold separately from text.
