A conventional gas reservoir is a relatively open system due to large porosity, high permeability, and good pore-throat connectivity, which is favorable for fluid flow and pressure conduction, with the gas reservoir pressure system close to the formation pressure. Shale reservoirs, due to their low porosity and permeability and their strong heterogeneity, are relatively a closed pressure system.

Gas Reservoir

Gas reservoir engineering is the branch of reservoir engineering that deals exclusively with reservoirs of non-associated gas. The prime purpose of reservoir engineering is the formulation of development and production plans that will result in maximum recovery for a given set of economic, environmental and technical constraints.

Fundamentals of Gas Reservoir Engineering, Volume 23

Reservoir engineering is a branch of petroleum engineering that applies scientific principles to the fluid flow through porous medium during the development and production of oil and gas reservoirs so as to obtain a high economic recovery. The working tools of the reservoir engineer are subsurface geology, applied mathematics, and the basic laws of physics and chemistry governing the behavior of liquid and vapor phases of crude oil, natural gas, and water in reservoir rock.
