Friday, January 19, 2018. Mechanical Dynamics & Analysis (MD&A) repaired a Frame 5 gas turbine rotor. MD&A replaced 1 st and 2nd stage buckets, repaired the seal area on the row 1 turbine wheel, performed compressor blade blending, and machined the thrust collar to accommodate the newer style thrust bearing at the No. 1 bearing. During their planned major inspection, the utility decided to remove the rotor based on prior recommendations from past borescope findings.

Case Study: Frame 5 Gas Turbine Rotor Repair / MD&A

Advanced aircraft engine and space technologies have been used to provide maintainable, flexible, light weight and compact aeroderivative gas turbines. The key to maintainability is the modular concept which provides for removal of components and replacement without removing the gas turbine from its support mounts. The heavy frame industrial units, by contrast, require more amount of effort to remove and replace components (especially combustor parts) and more effort to inspect or repair the ...
