Electron microscopy is used in the transmission mode (TEM) for thin samples or in the scanning mode (SEM) to image surfaces. Samples are stained in order to
enhance the contrast. Cryo-TEM consists in quenching the sample to low temperature in order to freeze the morphology into thin slices.

Physical Methods for Materials Characterisation : Peter E ...

Characterizing molding compound materials has generally been done from a chemical perspective; physical characterization has usually been limited to density, modulus/stiffness, thermal expansion, and moisture absorption. SAM offers the additional possibility of quantitatively measuring the molding compound degree of cure, homogeneity, porosity, and the overall distribution of filler.
