Worldwide, there are approximately 250 species of bumble bees. Over 40 bumble bee species are native to North America. Of these, only one species, *Bombus impatiens*, is currently reared by commercial producers in North America. Bumble bees vary greatly in size, with bees weighing from 40 to 830 milligrams (0.0014 to 0.029 ounces).

~~Natural History of Bumble Bees—
SARE~~

Bumble bees are social insects, living in colonies consisting of a queen and

unfertilized eggs laid by the queen, most hatch from eggs laid by workers. In early fall the queen stops laying eggs, and the colony, including the queen, gradually dies out. During this period the larvae of certain moths and beetles prey on the remaining eggs and larvae in the nest.

~~bumblebee | Description, Species, Life Cycle, & Facts ...~~

Biogeographic regions for bumblebees were derived using a TWINSPLAN classification. This divides the equal-area (611,000 km) grid-cells (see below and the map of species richness) into 12 groups by differences in the species composition of their bumblebee faunas (updated from Williams, 1996 [pdf]).

A bumblebee (or bumble bee, bumble-bee, or humble-bee) is any of over 250 species in the genus *Bombus*, part of Apidae, one of the bee families. This genus is the only extant group in the tribe Bombini , though a few extinct related genera (e.g., *Calyptapis*) are known from fossils .

Bumblebee — Wikipedia

Yellow bumble bees have declined in New York when comparing known post-2000 records to the number of all records pre-2000 based on presence of *B. fervidus* in proportion to the bumble bee populations in those years as a whole (data from Richardson 2013 and Yanega 2013). While the short-term trend indicates a rapid decline statewide, it has been ...
