1. Cylinder Block:- It is a container fitted with a piston, where the fuel is burnt and power is produced. Cylinder is the main body of the IC engine. Cylinder is a part in which the intake of fuel, compression of fuel and burning of fuel take place. The main function of the cylinder is to guide the piston. For cooling of the cylinder a water jacket (for liquid cooling used in most cars) or fin (for air cooling used in most of the bikes) is situated at the outer side of the cylinder.

An internal combustion engine is defined as an engine in which the chemical energy of the fuel is released inside the engine and used directly for mechanical work, as opposed to an external combustion engine in which a separate combustor is used to

*Design a four-cylinder Internal Combustion Engine ...

The internal combustion engine converts chemical energy into useful mechanical energy by burning fuel. Chemical energy is released when the fuel-air mixture is ignited by the spark in the combustion chamber. The gas produced in this reaction rapidly expands forcing the piston down the cylinder on the power stroke. Question 2. What Is 2-stroke Engine?
